“Getting to know you,
Getting to know all about you….”

Data types who cares?

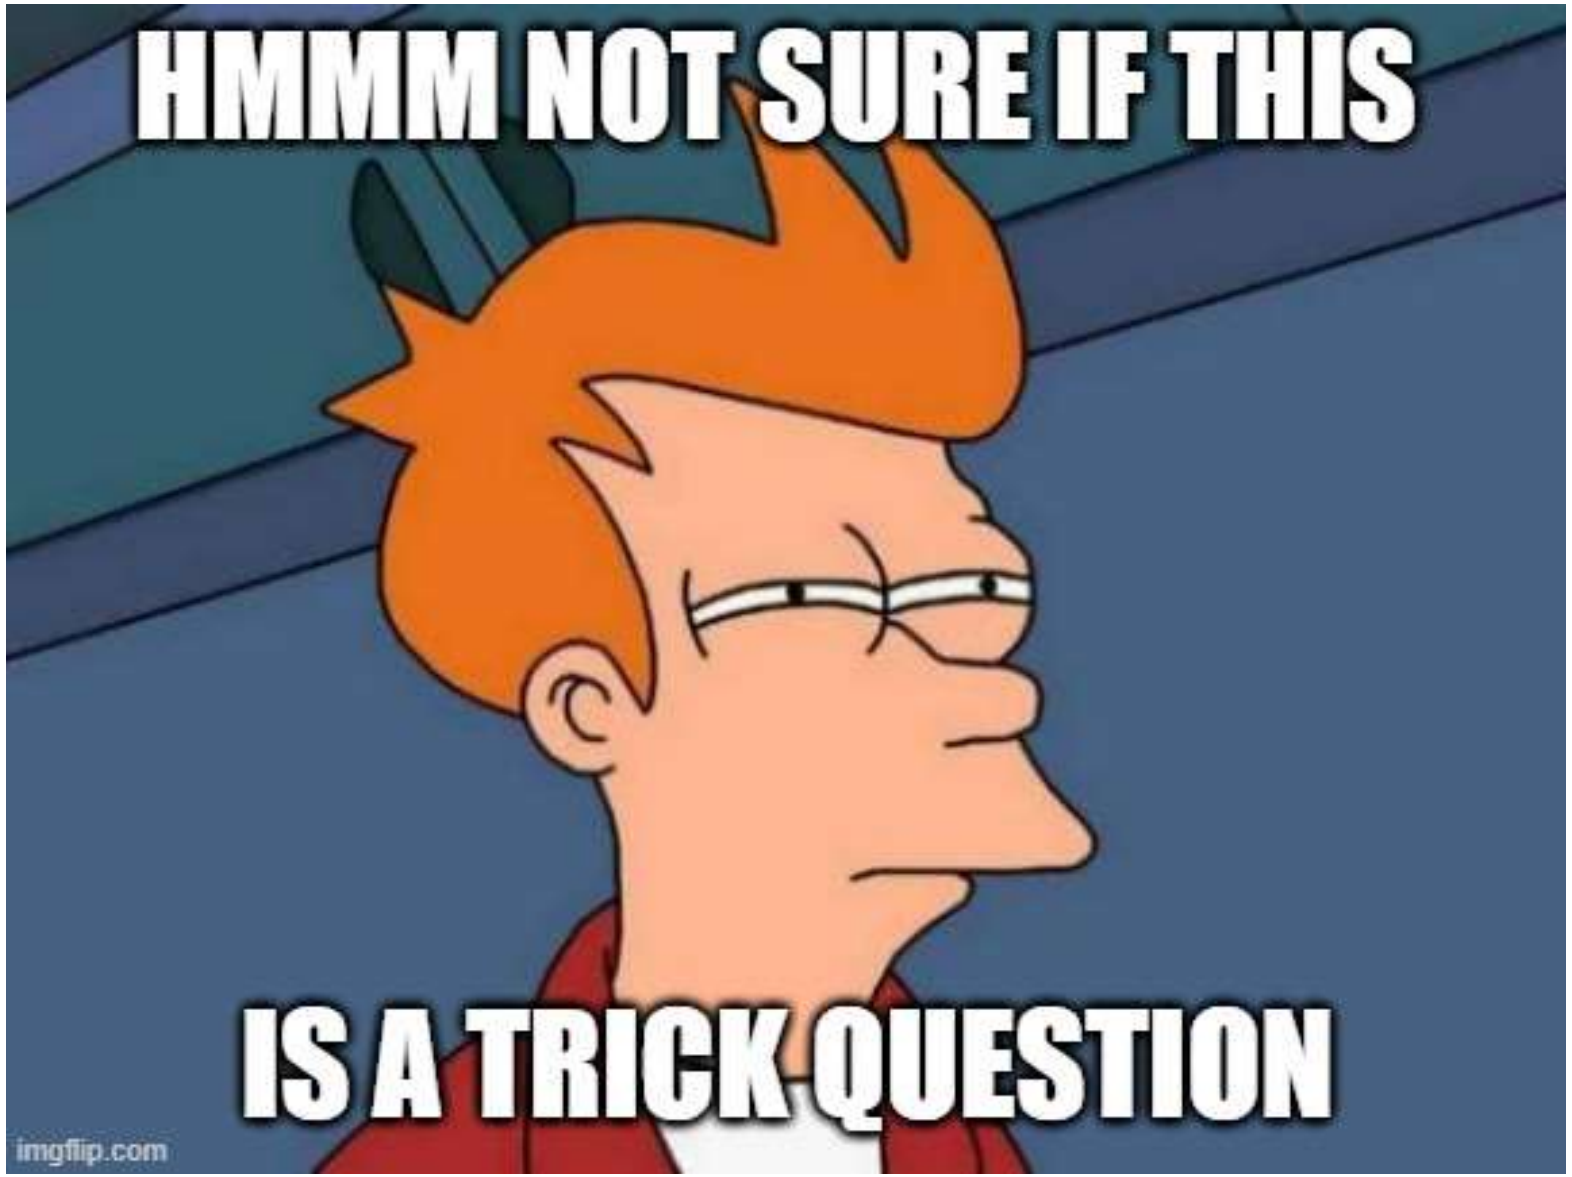

Question

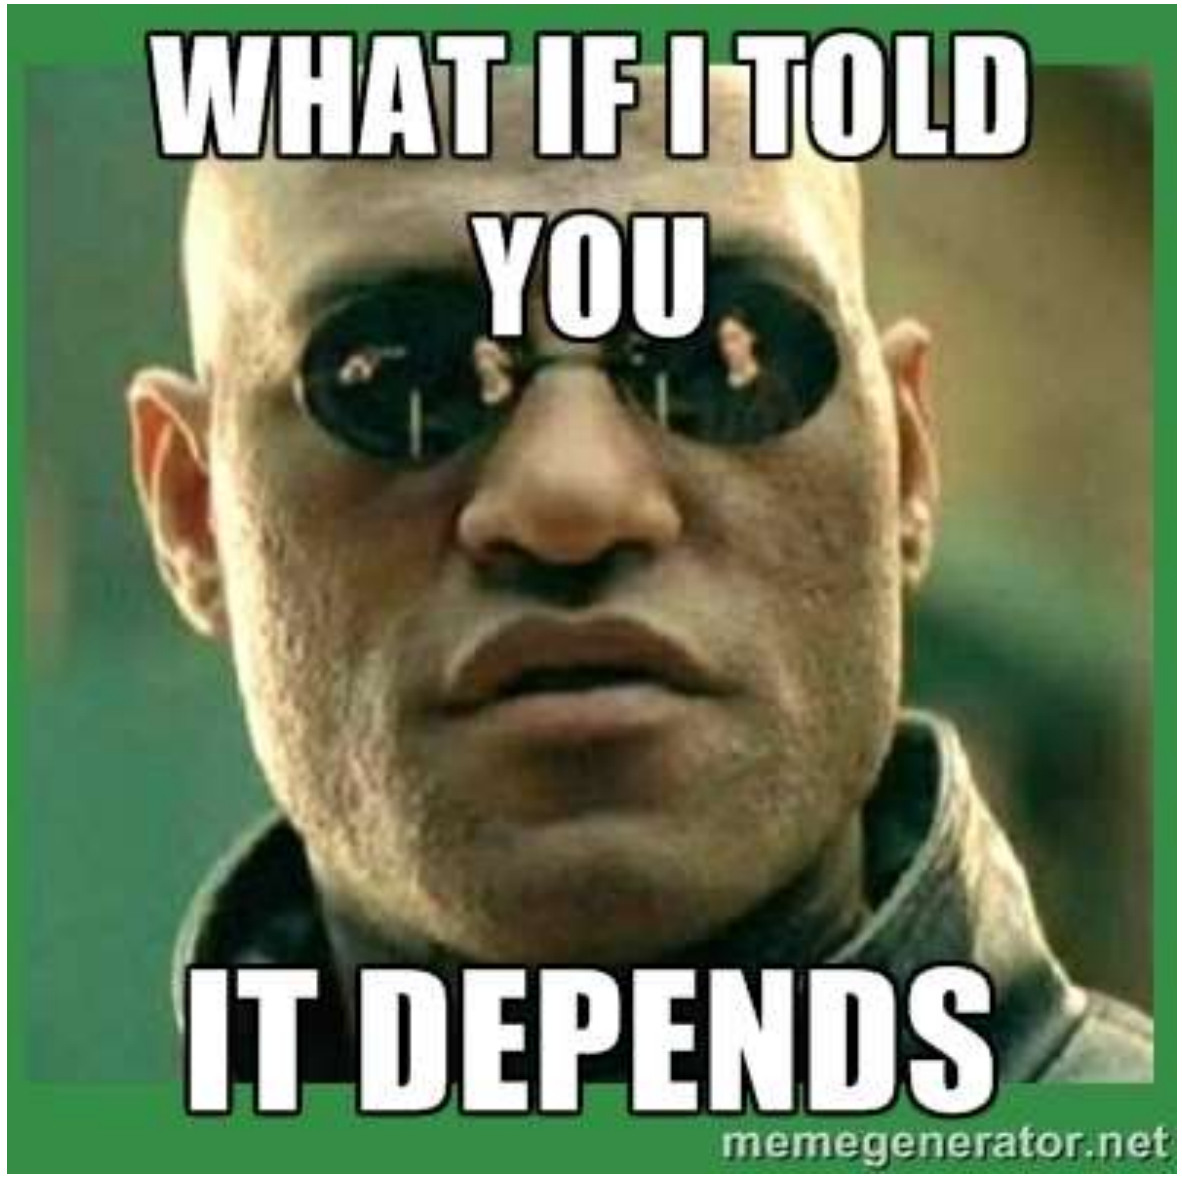

1) X + D = DX

2) X + D = XD

Hint X = 10 D = 500

https://www.romannumerals.org/converter

HMMM NOT SURE IF THIS
IS A TRICK QUESTION
imgflip.com

WHAT IF I TOLD YOU
IT DEPENDS
memegenerator.net

~~1) X + D = DX~~

2) “X” + “D” = “XD” ✓

500 + 10 = 510 ✓

I'm **NOT** a Pedant
(in the precise definition of the term)

Computers are pedantic !

Data Types – Numeric

Integer

Description - Can be positive or negative whole numbers

Example data – 17, 106 ,10256, -4568, 1082564

Real or Decimal

Description - Stores numbers that contain decimal places/values and can also store integers

Example data – 17.25, 106.2486515 ,10256.0, -4568.48, 1082564.1564

See - https://www.bbc.co.uk/bitesize/guides/zghbgk7/revision/1

Data Types

Character

Description – Stores a single character which can be letter, number or symbol

Example data – $, @, *, & 1, 5, 0

String

Description - Can store alphanumeric combinations and text. String is really a group of characters stored together as one. NB !!!! Numbers to be used for calculations should not be stored as string data even though they can be. They should be stored as INTEGER or REAL

Example data – Lovely, 106 , 3/11/2023, -14.25646, Good

See - https://www.bbc.co.uk/bitesize/guides/zghbgk7/revision/1

Other Data Types (yes there is a lot more)

Date Time

Description – Stores date and date time values

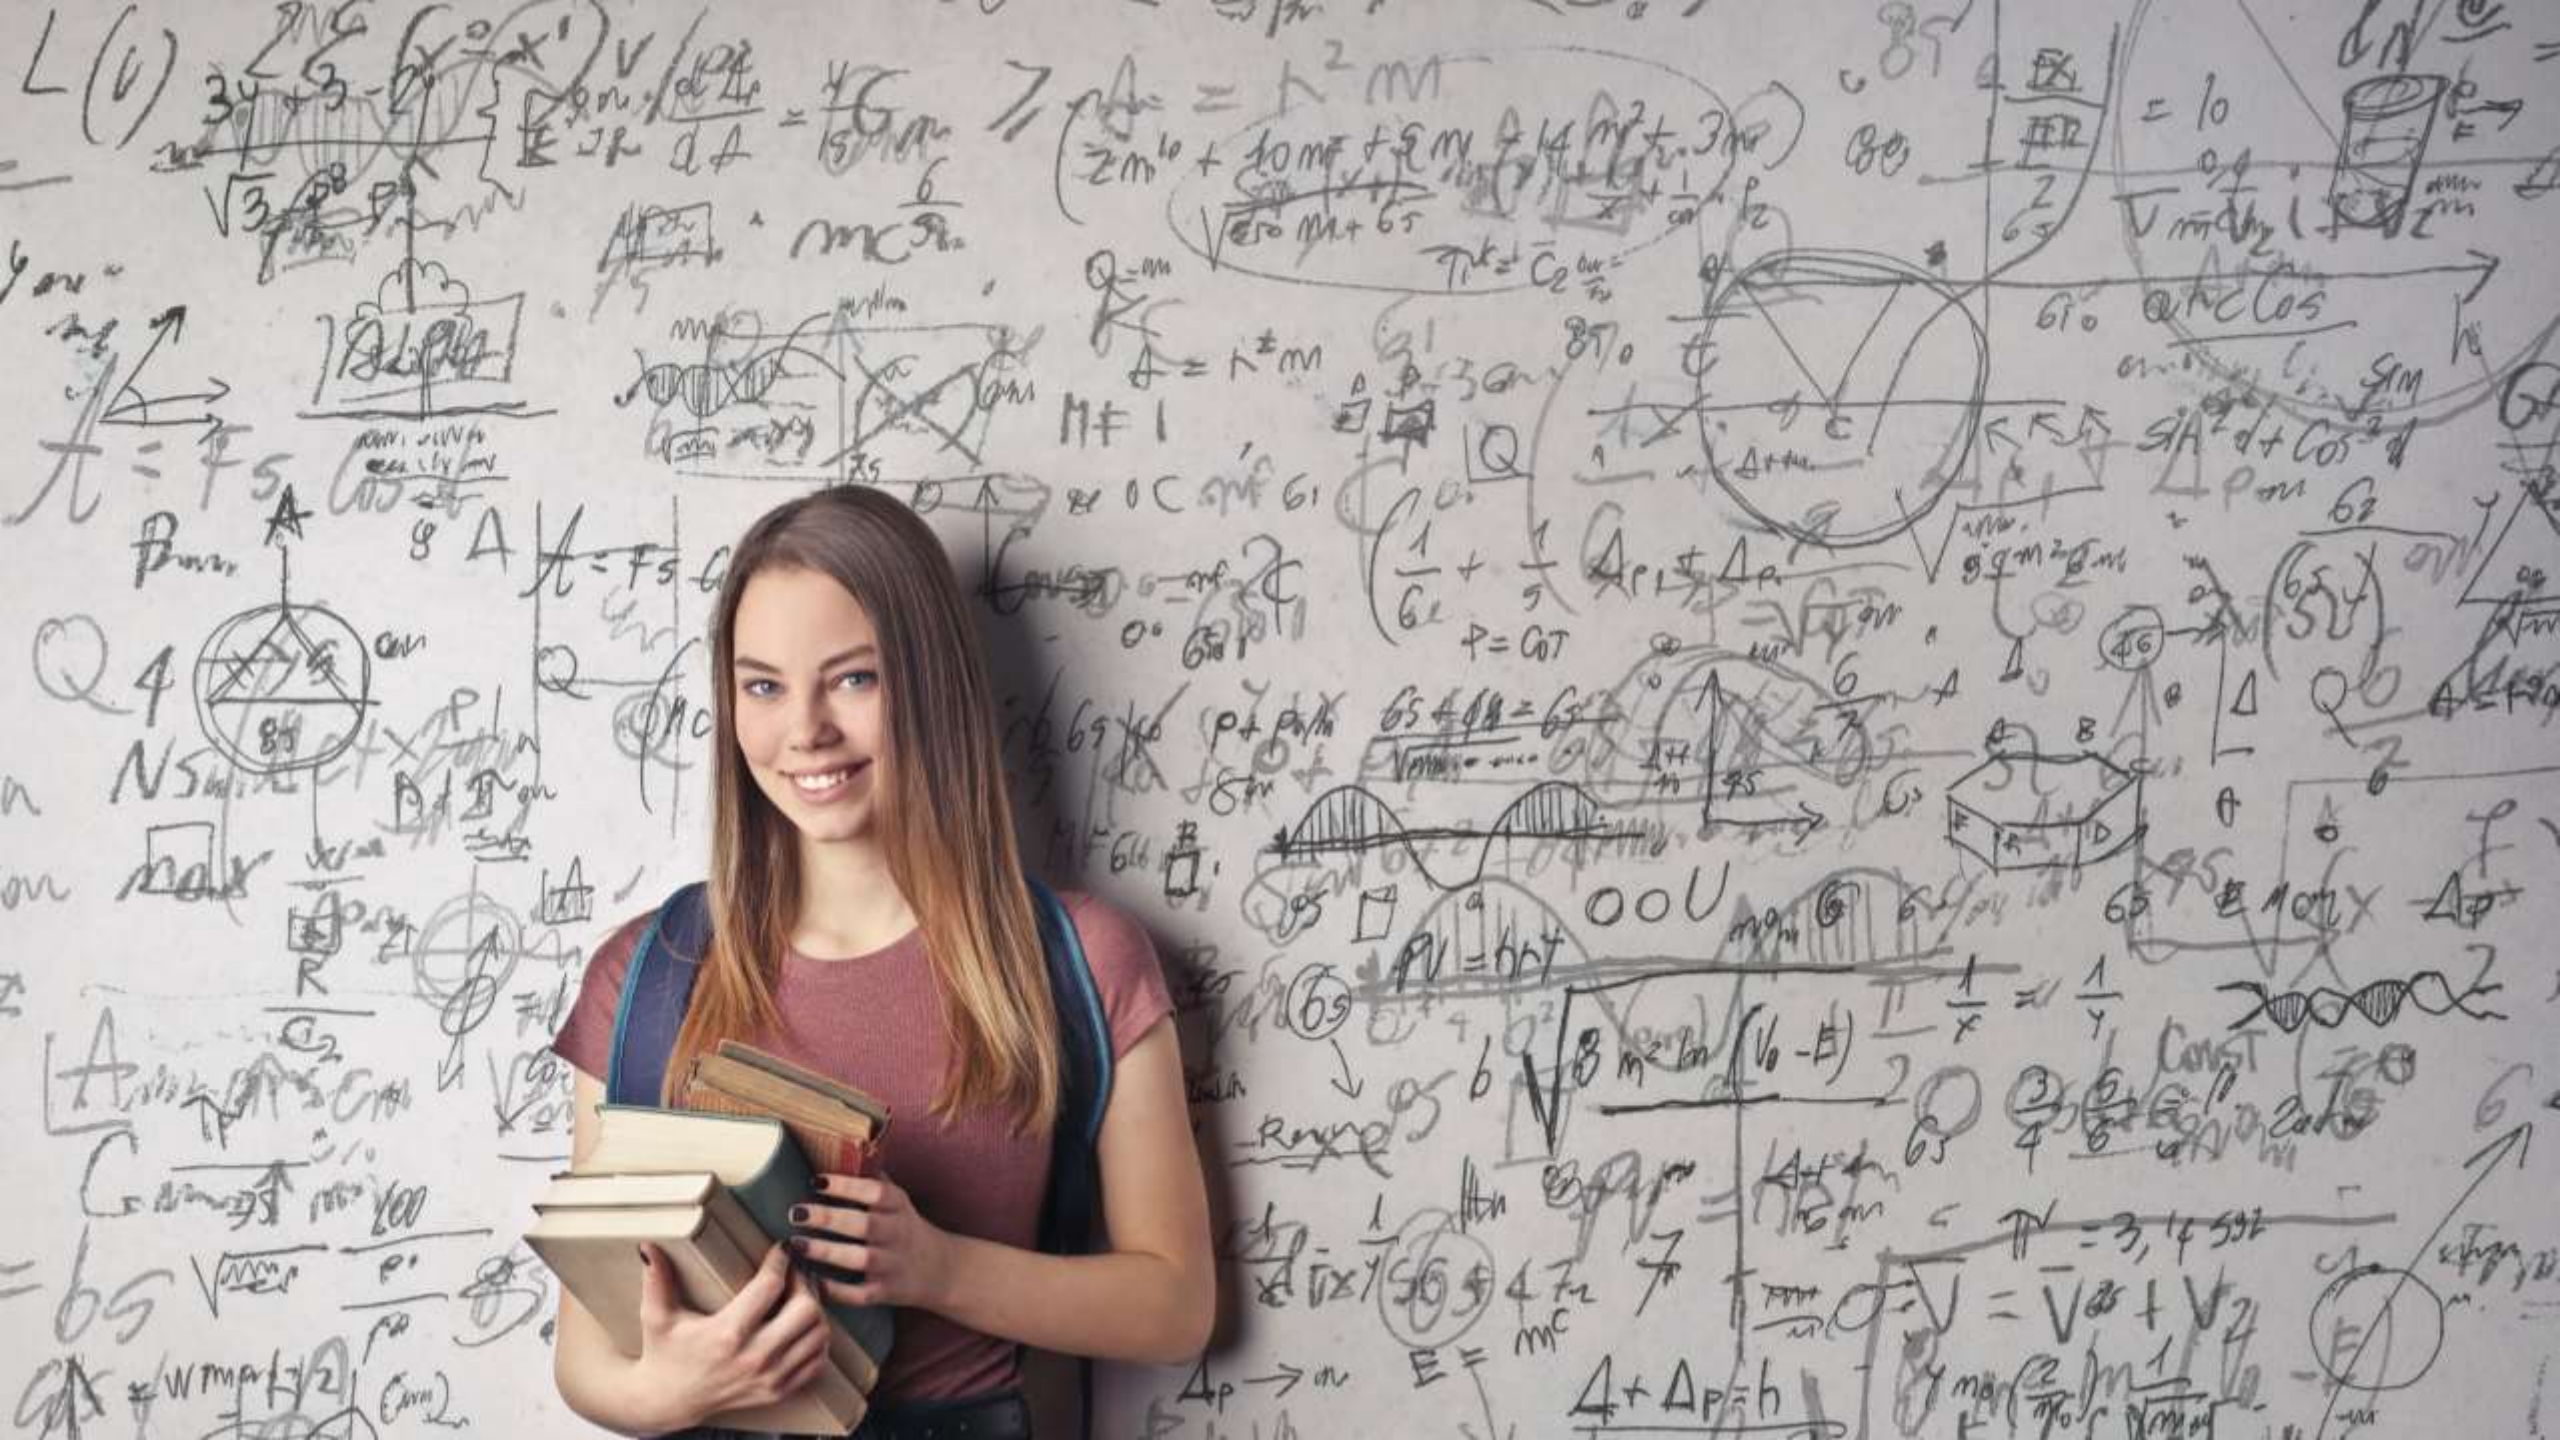

Example data – 2023-05-01, 2024-12-25 00:00:00, 21/04/1972

Boolean

Description - Stores True or False only. This is sometimes taught as 1 or 0 only where 1 is true and 0 false

Example data – 0, 1, True, False

See - https://www.bbc.co.uk/bitesize/guides/zghbgk7/revision/1

Qualitative

- Also know as Categorical

- Two main types
  - Nominal
  - Ordinal

  “Data that is not defined as a number.
  Can be used to express a measurement of some form.”

Qualitative - Nominal

- *Define*

  Cannot be assigned any order

  Allocated to distinct categories

  Categories have no meaningful order

- *Examples*

  Hair colour

  Martial Status

  House type

  Family name

  Country born in

  Binary – variables that have two choice

  Got a driving licence?

  Do you work for Glasgow City Council?

Qualitative - Ordinal

- *Define*

  Values which can be ordered in categories difference between units is meaningless.

- *Examples*

  Blood group

  Clothes size

  Exam Grades

Quantitative

- Two main types
  - Discrete
  - Continuous

“Quantitative data is, quite simply, information that can be quantified. It can be counted or measured, and given a numerical value”

Quantitative – Discrete

- *Define*

  Can be counted, finite only certain values are possible. Integer values.

- *Examples*

  Number of people working for Glasgow City Council

  Shoe Sizes

  Number of people in this workshop

  Hours worked in a day (if rounded to the nearest hour)

Quantitative – Continuous

- *Define*

  Measured. Can have an infinite number of values within the interval

- *Examples*

  Height of children in a class

  Annual Rainfall In Scotland

  Speed of vehicles

  Time that was taken to create this workshop

Visual Vocabulary

There are so many ways to visualise data - how do we know which one to pick? Click on a category below to decide which data relationship is most important in your story, then look at the different types of charts within the category to form some initial ideas about what might work best. This list is not meant to be exhaustive, nor a wizard, but is a useful starting point for making informative and meaningful data visualisations.

Click any section below to view the charts

Deviation

Emphasise variations (+/-) from a fixed reference point. Typically the reference point is zero but it can also be a target or a long-term average. Can also be used to show sentiment (positive/neutral/negative).

Correlation

Show the relationship between two or more variables. Be mindful that, unless you tell them otherwise, many readers will assume the relationships you show them to be causal (i.e., one causes the other).

Ranking

Use where an item's position in an ordered list is more important than its absolute or relative value. Don't be afraid to highlight the points of interest.

Distribution

Show values in a dataset and how often they occur. The shape (or 'skew') of a distribution can be a memorable way of highlighting the lack of uniformity or equality in the data.

Change over Time

Give emphasis to changing trends. These can be short (intra-day) movements or extended series traversing decades or centuries: Choosing the correct time period is important to provide suitable context for the reader.

Part-to-Whole

Show how a single entity can be broken down into its component elements. If the reader's interest is solely in the size of the components, consider a magnitude-type chart instead.

Magnitude

Show size comparisons. These can be relative (just being able to see larger/bigger) or absolute (need to see fine differences). Usually these show a 'counted' number (for example, barrels, dollars or people) rather than a calculated rate or per cent.

Spatial

Used only when precise locations or geographical patterns in data are more important to the reader than anything else.

Flow

Show the reader volumes or intensity of movement between two or more states or conditions. These might be logical sequences or geographical locations.
